

1. $E_k = \frac{\hbar^2 k^2}{2m}$, 写出当 $k \rightarrow 0$, dk 和 E 的关系, 并由此写出电子态密度表达式 (一维晶格)

2. $E_k = +\alpha k^2 - \beta |k|$, 写出电子态密度 (提示: 利用 $\delta(\alpha(x)) = \sum_n \frac{\alpha'(x_n)}{|\alpha'(x_n)|}$) (一维晶格)

1.
由 $E_k = \frac{\hbar^2 k^2}{2m}$ 得 $k = \frac{\sqrt{2mE_k}}{\hbar}$ $\therefore dk = \frac{\sqrt{2m}}{\hbar} \frac{1}{2\sqrt{E_k}} = \frac{1}{\hbar} \sqrt{\frac{m}{2E_k}}$

由 $g(E) dE \cdot L^D = 2 \cdot \frac{2dk}{(2\pi)^D} \Rightarrow g(E) = \frac{2}{\pi} \frac{dk}{dE} = \frac{2}{\pi} \frac{1}{\hbar} \sqrt{\frac{m}{2E_k}} = \frac{1}{\pi \hbar} \sqrt{\frac{2m}{E_k}}$

2.

$$g(E) = 2 \cdot \frac{1}{2\pi} \int_{-\infty}^{\infty} \delta(E - E_k) dk = \frac{1}{\pi} \int_{-\infty}^{\infty} \delta(E - \alpha k^2 + \beta |k|) dk = \frac{1}{\pi} \int_{-\infty}^{\infty} \sum_n \frac{\delta(k - k_0)}{|\frac{\partial E}{\partial k}|} dk$$

当 $k > 0$ $E = \alpha k^2 - \beta k$ $|\frac{\partial E}{\partial k}| = |2\alpha k - \beta|$ $k_0 = 0, \frac{\beta + \sqrt{\beta^2 + 4\alpha E}}{2\alpha}, \frac{-\beta - \sqrt{\beta^2 + 4\alpha E}}{2\alpha}$

$$\therefore g(E) = \frac{1}{\pi} \int_{-\infty}^{\infty} \frac{\delta(k - 0)}{|\beta|} + \frac{\delta(k - \frac{\beta + \sqrt{\beta^2 + 4\alpha E}}{2\alpha})}{|-\sqrt{\beta^2 + 4\alpha E}|} + \frac{\delta(k - \frac{-\beta - \sqrt{\beta^2 + 4\alpha E}}{2\alpha})}{|2\beta + \sqrt{\beta^2 + 4\alpha E}|} dk$$

$$= \frac{1}{\pi} \left(\frac{1}{|\beta|} + \frac{1}{\sqrt{\beta^2 + 4\alpha E}} + \frac{1}{2\beta + \sqrt{\beta^2 + 4\alpha E}} \right)$$
